Fast, flexible access to the latest technologies

Radianz Hosting gives you end-to-end managed, secure and reliable infrastructure out of data centres. This means your applications and services can be distributed to global financial service industry customers. By outsourcing with a trusted partner, you can free up internal IT resource to focus on your core business.

You're interconnected with our financial services companies to consume each other's services. This covers the overall trade cycle, from pre-trade, trade, to post-trade and settlement. Historically, fragmented infrastructures were provided across local, regional and global markets.

The business benefits of lower latency for market data and matching engines resulted in the need for you to be in close proximity to where liquidity resides and trades are matched. You probably migrated your infrastructure into data centre locations not only connecting to local market data and matching engines, but also to cross-connect to a growing local financial community.

The evolution of this trend led to a high concentration of financial industry companies co-located within key data centres globally. Exchanges themselves offered co-location services as part of their business model and also became strategically important.

Our outsourced infrastructure also helps you

- reduce complexity and total cost of ownership
- expand into new markets or asset classes
- give access to clients and services locally
- lower IT infrastructure cost
- decrease hosted infrastructure downtime
- leverage our expertise and new technologies
- adapt quickly to an ever-changing market environment and maintain scalability
- remove time consuming and labour intensive administrative overheads and boosts higher IT staff productivity
- boost higher IT staff productivity.

We're a global partner with financial stability who can support your long-term strategies.

An end-to-end managed, secure infastructure

You may be facing these challenges:

- managing multiple suppliers
- covering geographical support
- adopting local processes

when expanding into new data centres in key financial markets. It becomes complex and costly to setup and manage.
