

## Keeping the capital safe

“For an organisation like ours, reliable communication is vital.”

Chidi Oparah, UC Project Manager, London Ambulance Service

BT iNet's partnership with the London Ambulance Service provides the communications services to help deal with any emergency

### Introduction

London is one of the most bustling and congested cities on Earth – even more so during major events such as student riots or Royal wedding celebrations. Whether planned or impromptu, these incidents can have a huge impact on the emergency services – and that's in addition to day-to-day accidents and the threat of terrorist attack.

As a result, the London Ambulance Service (LAS) is the busiest emergency ambulance service in the UK. Because it covers an area of 620 square miles and operates 24/7 in one of the most challenging environments in the world, the LAS has to offer a service that is always available and operating efficiently. It has therefore chosen BT iNet as its partner, to ensure that its technology infrastructure equips LAS staff to deal with every eventuality.

Part of the BT Group, BT iNet offers a range of communications services and solutions for organisations of all sizes. It has been able to use the full array of its portfolio to offer LAS benefits from cost efficiency to productivity and from greater collaboration to simpler management.

Explains Chidi Oparah, UC Project Manager for LAS: “We initially decided to transform our voice and data networks to meet increasing demands on our service. However, it became clear during our discussions with BT iNet that we could achieve maximum operational benefit, now and in the future, if

we were to deploy a unified communications platform at the same time as moving to IP telephony across our 80 sites.”

### Improving efficiency

To reduce complexity, individual IP phone numbers have been issued so that employees can log in at any phone on the network, regardless of location – which makes office moves and changes easier to organise. A contact centre has also been set up for the LAS technical support services team, which needs to deliver a 24/7 service, to help its 60 agents improve efficiency.

From a management perspective, the IT team at the London Ambulance Service is finding the system easier to run and audit. Fewer lines into each building save money, while IP telephony means that operational directors can be in constant contact with their teams, wherever they are based.

“For an organisation like ours, reliable communication is vital,” says Chidi Oparah. “Having a system down could severely impair our ability to do our job effectively. BT iNet has therefore installed a WAN acceleration solution and fibre ring network with alternate routing to give us resilient fall-back systems.”

### Conferencing for all

The success of the initial project led to further work to utilise the platform with video conferencing services being installed at eight locations to reduce travel to meetings. The 27 area officers, who used to travel to central London HQ every Monday morning, now only have to go to their local video conferencing site, saving money and reducing carbon emissions. The efficiencies gained in employee productivity have prompted

three more locations to be set up and a MeetingPlace® facility extended to all staff to enable them to initiate conference calls, live meetings and collaborative web sessions at a moment's notice.

In a second project phase, BT iNet has developed a digital media signage solution for the LAS Command and Control Centre to help deploy its ambulances more effectively in the busy capital. Accessing free live video footage from Transport for London, the BBC, Sky News and others, an event commander can see London's hotspots, assess what is happening and decide what resources need to be allocated. The screens give live 'red, amber, green' feedback on LAS vehicles, so that there is always clarity on their availability, allowing them to be more quickly mobilised.

“Information like this is invaluable when dealing with large scale events such as New Year's Eve celebrations. It could literally mean the difference between life and death for someone,” comments Chidi.

Further plans are being finalised to upgrade the BT iNet solution to enable instant messaging and presence capabilities across the service, along with moving the 999 back-up service to the IPT platform.

Concludes Chidi: “BT iNet has been a very knowledgeable and flexible partner. The team went above and beyond our expectations to deliver this ground-breaking and complex solution in a challenging environment. The level of experience and expertise was first class, flawlessly deploying the solution with no impact on day-to-day operation, and we know we can trust the team to continue to work with us to provide the most effective service possible.”

Offices worldwide

The services described in this publication are subject to availability and may be modified from time to time. Services and equipment are provided subject to the respective British Telecommunications plc standard conditions of contract. Nothing in this publication forms any part of any contract. The meaning of the word partner or partnership in this case study does not give rise to a partnership as defined in the Partnership Act 1890 or other relevant law.
